The Workflow of CFD Simulation with ANSYS

Learning CFD involves understanding the typical workflow, which can be summarized as follows:

- Geometry Creation and Preparation**

Import CAD models or create geometry within ANSYS DesignModeler or SpaceClaim. Simplify geometries to reduce computational load while retaining essential features. Identify and define regions of interest, such as inlets, outlets, and

walls.

Meshing Generate a computational grid that divides the geometry into discrete elements. Use structured, unstructured, or hybrid meshes depending on geometry complexity. Perform mesh independence studies to ensure results are not sensitive to mesh size.

Physics Setup Select appropriate models: turbulence, heat transfer, multiphase, etc. Define boundary conditions: velocity, pressure, temperature, etc. Assign material properties relevant to the fluids and solids involved.

Solution and Computation Set solver parameters: convergence criteria, time steps for transient simulations. Run simulations on local machines or high-performance clusters. Monitor residuals and key variables to ensure solution stability.

Post-Processing and Analysis Visualize velocity vectors, pressure contours, temperature distributions. Generate reports and extract quantitative data. Compare simulation results with experimental data for validation.
